1.

Def: cloud computing is the delivery of computing services like storage, servers, and software through the internet

four characteristics

* on demand service: Resources are available whenever needed
* Broad network access: services can be accessed using mobile and computers
* Resource pooling: resources are shared among in many users:
* Rapid elasticity: Resources can be increased or decreased easily

2. explanation evolution of cloud computing

cloud computing developed through the following steps

1. mainframe: large computers served many users
2. Personal computers: individual computers became popular

3. client server: computer connected to central servers

4. Distributed computing: multiple computa tairing worked together working

3) Explain server virtualization

It is a technology that divides one physical server into multiple virtual mach ine

Role

1. Reduces hardware cost
2. uses resources efficiently
3. Runs multiple OS
4. creates virtual machines easily

virtualization

* It is a technology
* create virtual machine
* Eg: VMware

cloud computing

* It is service model
* provides services through the internet

Eg: AWS
